SDITO Lab PC-CS6G4

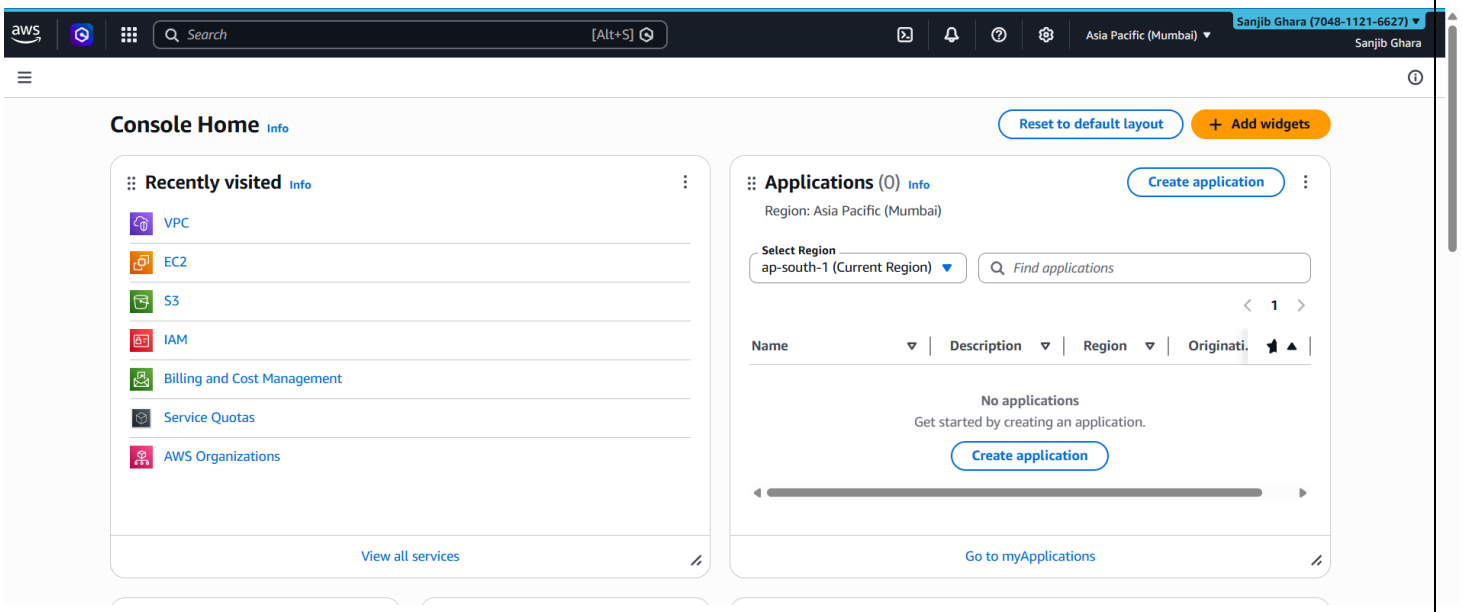
Name : Sanjib Ghara **Roll No :** CSE/23/065 **Exam Roll No :** 11600223092

Assignment 15

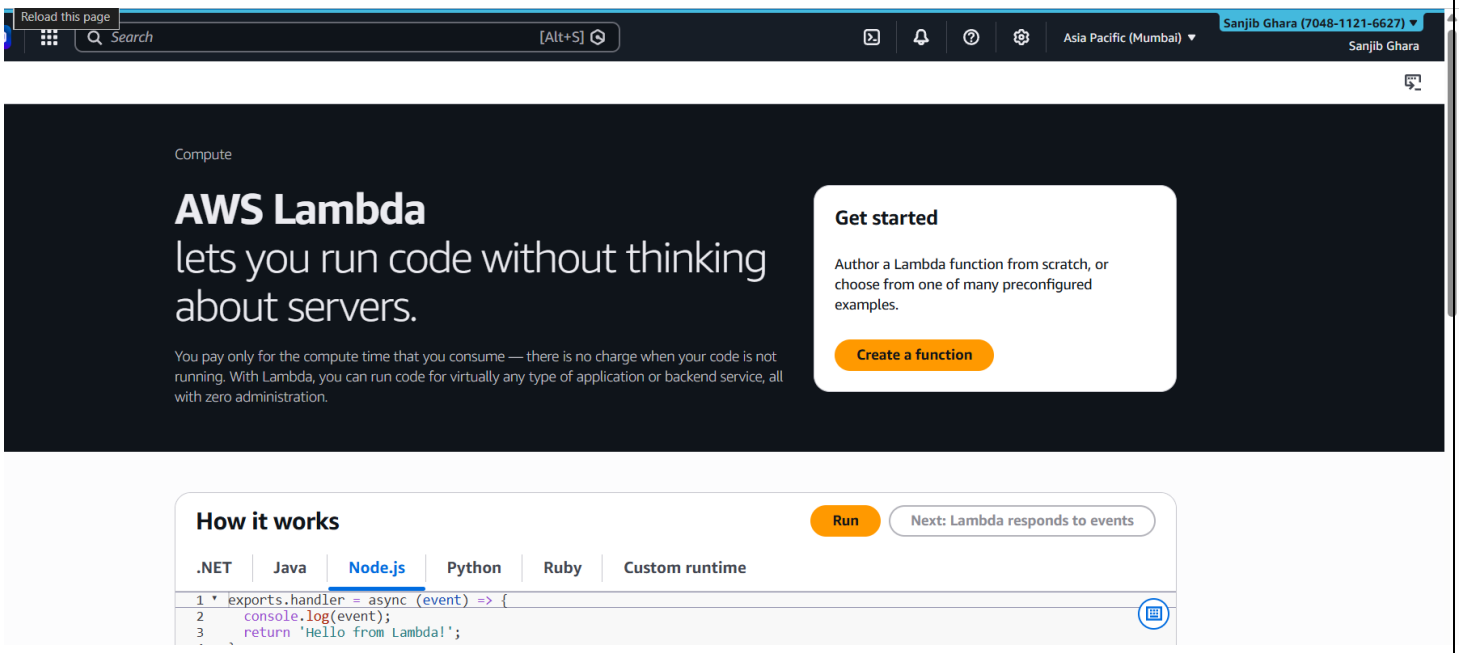
Problem Statement : Create a Serverless computing service.

Solution:

STEP 1: Login to AWS Console



1. Search **lambda**
2. Click **Create function.**



Step 2:- configuration

- Funtion name- sanjib-asg15
- Select runtime language- (in my case Nodejs24.x)
- Select architechture- x86_64

aws | Search [Alt+S] | Asia Pacific (Mumbai) | Sanjib Ghara (7048-1121-6627) | Sanjib Ghara

Lambda > Functions > Create function

Create function Info

Choose one of the following options to create your function.

- Author from scratch — Start with a simple Hello World example.
- Use a blueprint — Build a Lambda application from sample code and configuration presets for common use cases.
- Container image — Select a container image to deploy for your function.

Basic information

Function name
Enter a name that describes the purpose of your function.
sanjib-asg15
Function name must be 1 to 64 characters, must be unique to the Region, and can't include spaces. Valid characters are a-z, A-Z, 0-9, hyphens (-), and underscores (_).

Runtime Info
Choose the language to use to write your function. Note that the console code editor supports only Node.js, Python, and Ruby.
nodejs24.x

Durable execution - *new* Info
Enable durable execution to simplify building resilient multi-step applications that checkpoint progress and resume after interruptions. Supports Python and Node.js runtimes. View pricing.
Enable

Architecture Info
Choose the instruction set architecture you want for your function code.
arm64
x86_64

Info | Tutorials

Learn how to implement common use cases in AWS Lambda.

Create a simple web app

In this tutorial you will learn how to:

- Build a simple web app, consisting of a Lambda function with a function URL that outputs a webpage
- Invoke your function through its function URL

Learn more

Start tutorial

- **ADDITIONAL CONFIGURATION:**
  - Networking -> function URL(enable)
  - Auth type -> none
  - Then press **create function**

aws | Search [Alt+S] | Asia Pacific (Mumbai) | Sanjib Ghara (7048-1121-6627) | Sanjib Ghara

Lambda > Functions > Create function

Additional configurations

Use additional configurations to set up networking, security, and governance for your function. These settings help secure and customize your Lambda function deployment.

Compute type
Select a compute type: Serverless with pay-per-use pricing and automatic scaling, or Enhanced Scaling on EC2 instances with dedicated capacity and different pricing. This setting can't be changed after function creation.

- Lambda (default)
  Automatically scales and runs code without server management. Pay only for the compute time you use.
- Lambda managed instances - *new*
  Run on EC2 instances managed by Lambda with enhanced compute scaling. You must create a capacity provider first to use this option. Different pricing model applies based on EC2 usage. View pricing.

Networking

Function URL Info
Use function URLs to assign HTTP(S) endpoints to your Lambda function.
Enable

Auth type
Choose the auth type for your function URL. Learn more

- AWS_IAM
  Only authenticated IAM users and roles can make requests to your function URL.
- NONE
  Lambda won't perform IAM authentication on requests to your function URL. The URL endpoint will be public unless you implement your own authorization logic in your function.

Function URL permissions

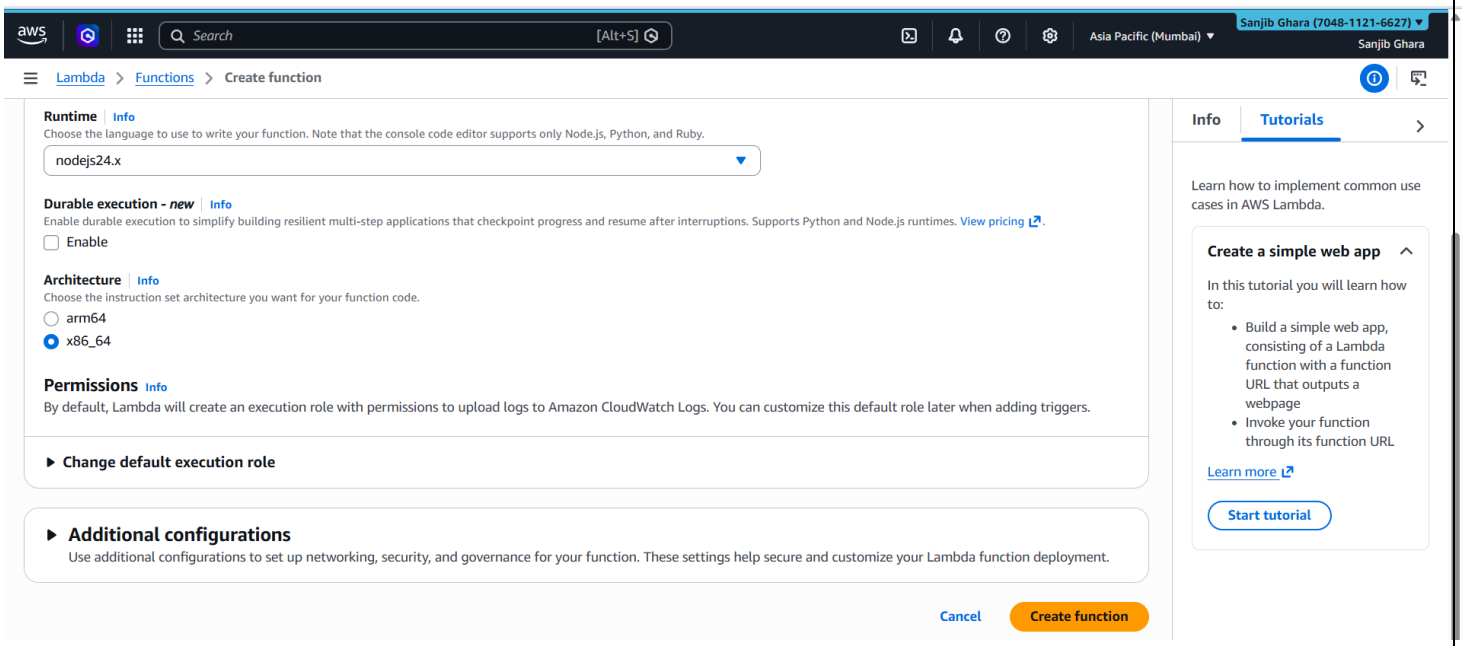
Create a simple web app

In this tutorial you will learn how to:

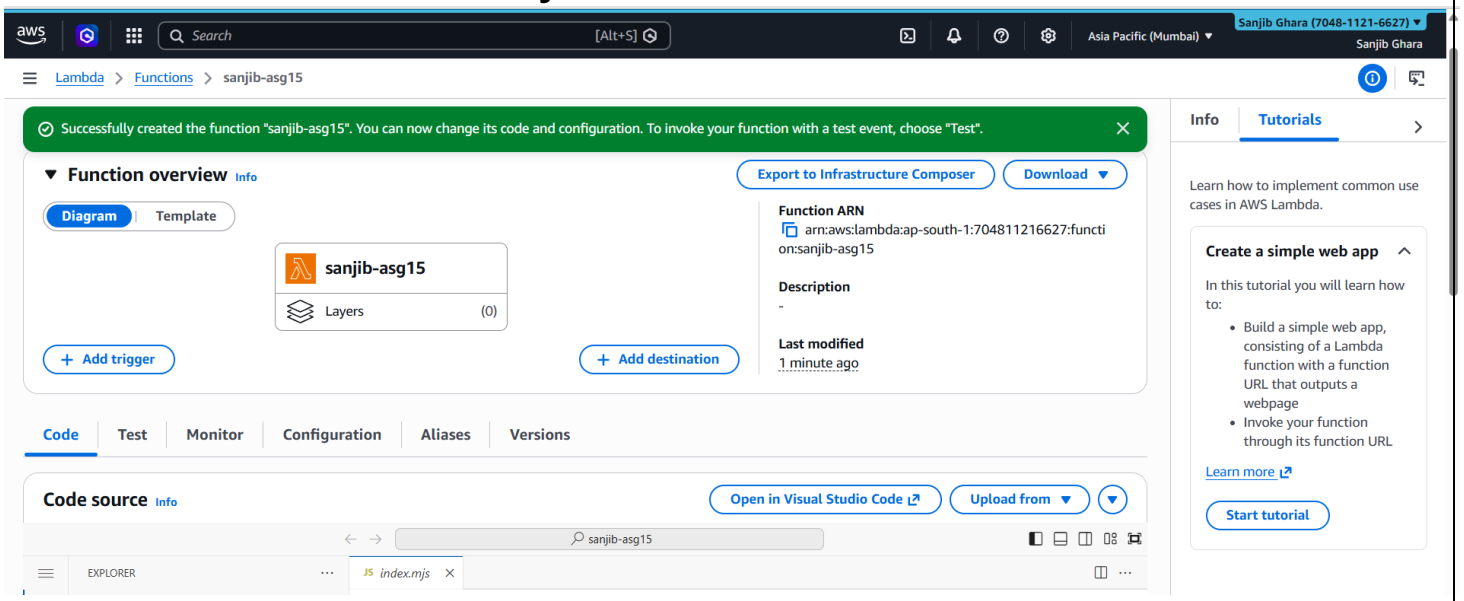
- Build a simple web app, consisting of a Lambda function with a function URL that outputs a webpage
- Invoke your function through its function URL

Learn more

Start tutorial

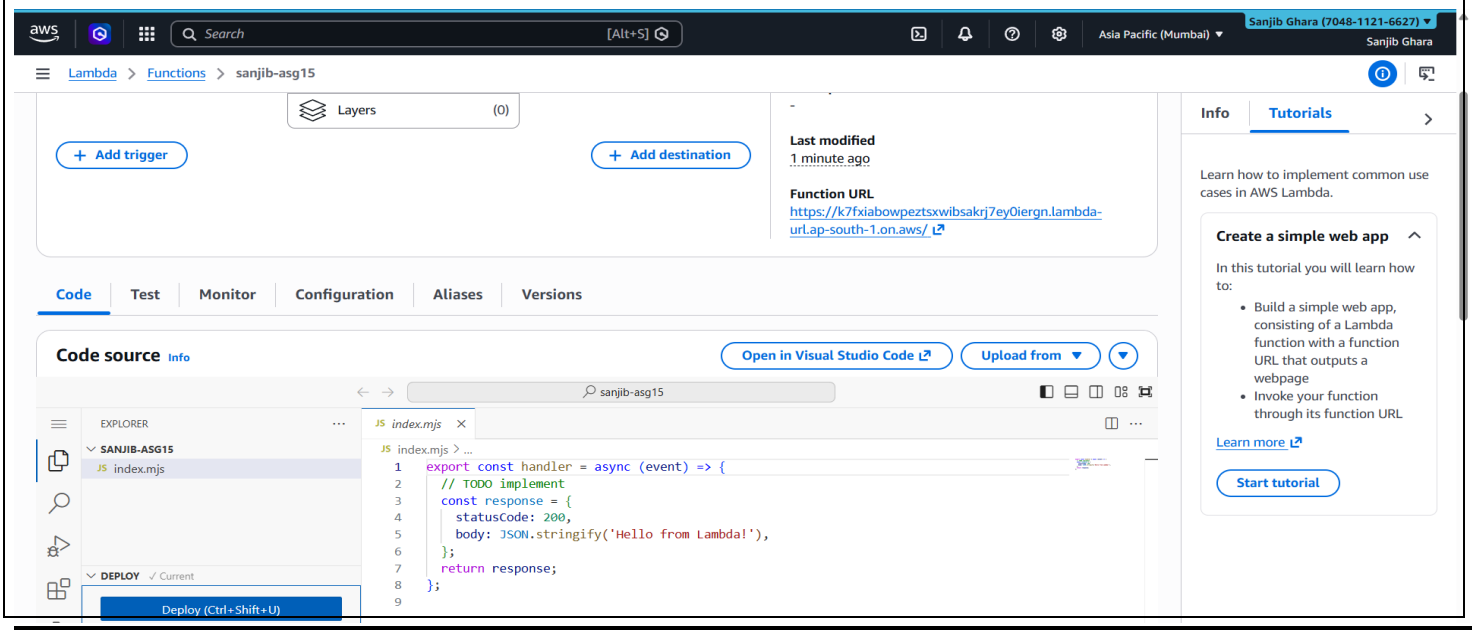


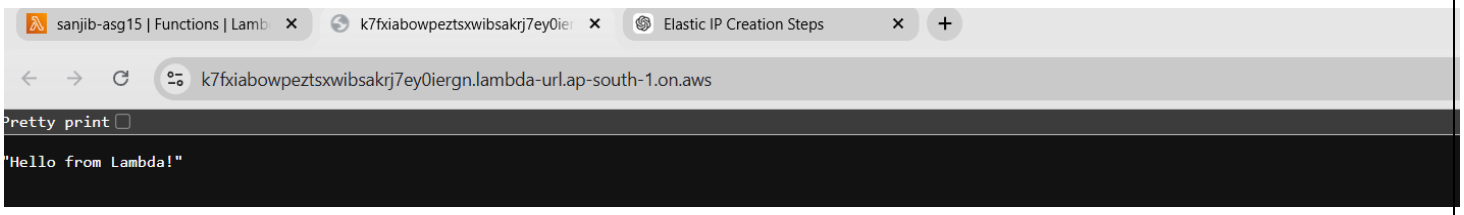
- **Function successfully created.**



Step 3: cheking serverless Deploy

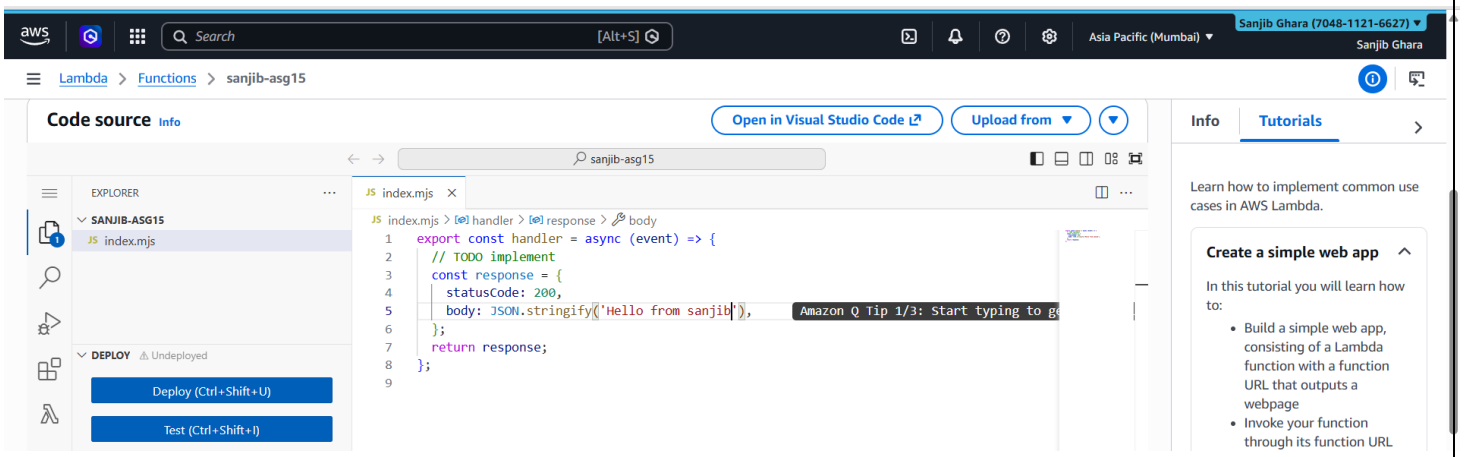
- Click on **funtional url**

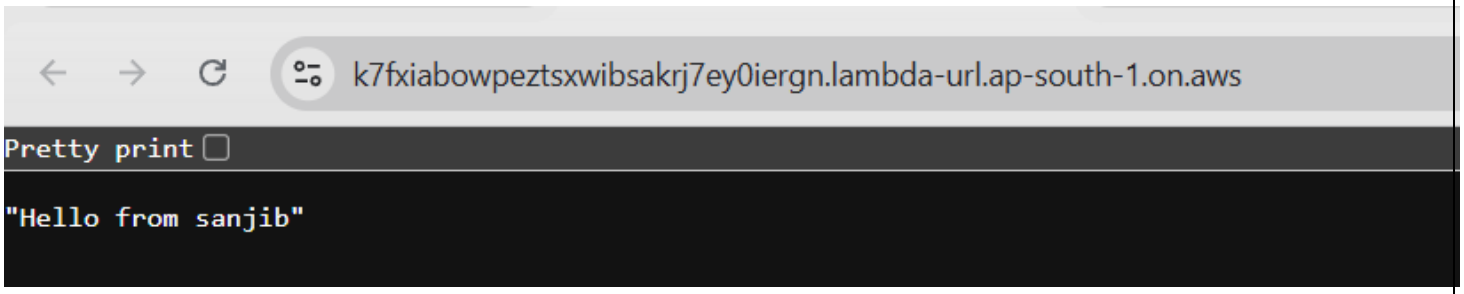




Step 4:- update code and deploy

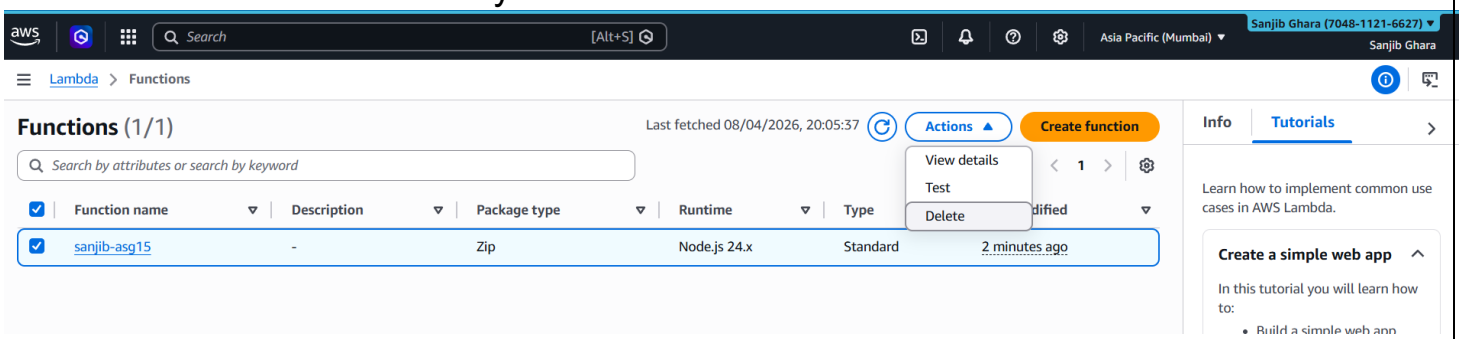
- Update the **lambda as Sanjib inside stringfy.**
- **Then click on deploy**
- **Then refresh the url.**

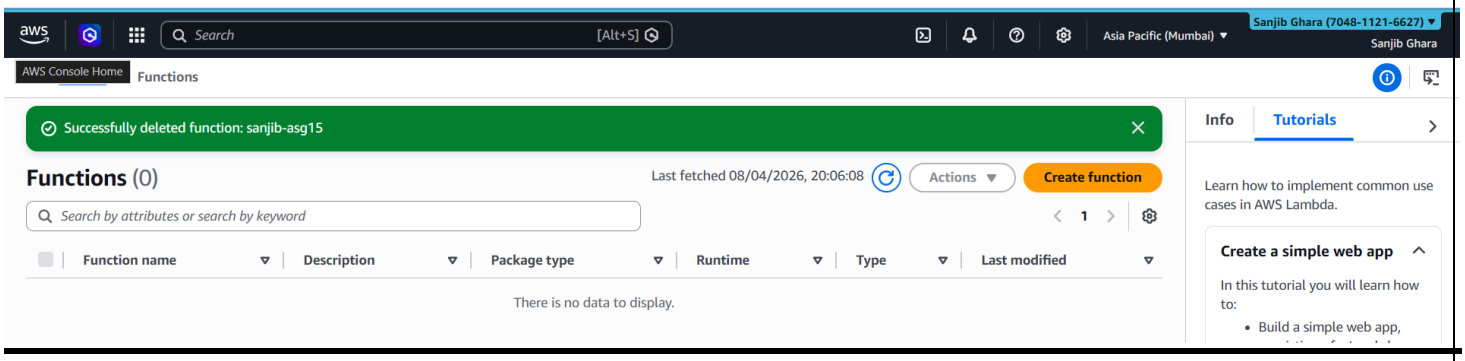




STEP5: delete the function

- At first select the function
- Then press on **action.**
- **Then click on DELETE.**
- The function successfully deleted.





Conclusion:

Serverless computing in AWS allows developers to run applications **without managing servers or infrastructure**. Using services like **AWS Lambda**, users can execute code automatically in response to events while AWS handles scaling, availability, and resource management. This approach reduces operational complexity, lowers cost, and enables faster development and deployment of applications.
